# Power for the long haul.

— ELECTRIC FREIGHT. REIMAGINED.

## Investor business plan

A proposed charging network for electric semi-trucks

[semisocket.com](https://semisocket.com) / September 2026 / Concept-stage draft

# The opportunity in electric freight

Fleet adoption creates demand for charging that fits commercial routes.

## 400,000+

**electric trucks sold globally in 2025**

IEA reports a 9% global sales share.  
China represented over 90% of electric truck sales.

Global growth is context. Local fleet demand must justify each US site.

Source: IEA, Global EV Outlook 2026, Trends in other EV modes (medium and heavy trucks).

## The customer problem

Fleets need dependable charging without rebuilding every depot or risking route delays.

## SemiSocket's entry point

Shared hubs for repeat regional routes, with fleet reservations and predictable billing.

# The SemiSocket station

A familiar fuel-stop experience designed around trucks and trailers.

## Six pull-through charging bays

Proposed 400 kW dispensers sharing a 2 MW site power limit. Final design follows fleet needs.

## Payment and fleet access

White dispensers, lime S branding, live readout and card payment. Fleet accounts add reservations and invoicing.

Concept rendering. Hardware and site layout subject to engineering.

# A fleet-backed pilot comes first

Proposed rollout begins after development funding. Dates depend on utility delivery.

| Window        | Workstream                             | Decision gate                         |
|---------------|----------------------------------------|---------------------------------------|
| Months 0-3    | 20 fleet interviews and route analysis | Two qualified anchor prospects        |
| Months 3-6    | Site options and utility studies       | Costed power plan and site control    |
| Months 6-12   | Contracts, permits and financing       | Target $\geq 2.4$ GWh/year contracted |
| Months 12-24+ | Build, commission and validate         | Expansion after six months of data    |

## Initial market screening

Inland Empire, Phoenix and Dallas-Fort Worth. Select one pilot using fleet demand, power cost, truck access and connection timing.

# Competition and the opening for SemiSocket

Existing operators validate the category and raise the bar for execution.

| Alternative         | Published offer / strategic tradeoff                          |
|---------------------|---------------------------------------------------------------|
| Terawatt            | Fleet charging hubs, pull-through bays and monthly billing    |
| Greenlane           | Public truck charging, driver amenities and fleet services    |
| Fleet-owned depots  | Operational control, with capital and power-delivery burden   |
| SemiSocket proposal | Smaller shared hubs at sites supported by anchor fleet demand |

## The proposed advantage

Proposed edge: site access and fleet commitments on specific routes. Advantage remains unproven.

Sources: [terawattinfrastructure.com/solutions/trucking-fleets](https://terawattinfrastructure.com/solutions/trucking-fleets) and [drivegreenlane.com/locations/colton-ca](https://drivegreenlane.com/locations/colton-ca) (Sept. 2026).

# How SemiSocket earns revenue

Energy sales provide the core revenue. Fleet agreements support predictable use.

## Charging revenue

Illustrative realized price: \$0.45/kWh. Fleets negotiate volume commitments and reserved access.

## Operating model

Lease suitable sites. Buy proven equipment. SemiSocket manages customers, billing and uptime.

Base model excludes parking and amenity income.

Concept rendering

# Pilot economics depend on utilization

Illustrative six-bay site: 400 kWh/session, 365 days/year. No subsidies or debt.

| Annual metric            | Low use   | Base case | High use  |
|--------------------------|-----------|-----------|-----------|
| Sessions per day         | 12        | 24        | 36        |
| Energy delivered         | 1.752 GWh | 3.504 GWh | 5.256 GWh |
| Charging revenue         | \$0.788M  | \$1.577M  | \$2.365M  |
| Site EBITDA <sup>1</sup> | \$0.088M  | \$0.526M  | \$0.964M  |

**\$0.45/kWh sales – \$0.20/kWh variable cost – \$350K annual fixed cost**

~10 sessions/day operating break-even. Base simple capex payback: ~8.6 years.

<sup>1</sup> Before corporate costs, debt, tax, depreciation and equipment replacement. A \$0.05/kWh cost increase cuts base EBITDA by \$175K.

# Three-year operating scenario

Years begin with first pilot energization. Expansion requires additional capital.

| USD millions, unless indicated  | Year 1    | Year 2    | Year 3    |
|---------------------------------|-----------|-----------|-----------|
| Sites at year-end / site-years  | 1 / 0.5   | 2 / 1.5   | 4 / 3.0   |
| Sessions/day per operating site | 12        | 20        | 24        |
| Revenue                         | \$0.394   | \$1.971   | \$4.730   |
| Site EBITDA                     | \$0.044   | \$0.570   | \$1.578   |
| Corporate overhead              | (\$0.600) | (\$0.800) | (\$1.000) |
| Consolidated EBITDA             | (\$0.556) | (\$0.230) | \$0.578   |
| New-site capital spending       | \$4.500   | \$4.500   | \$9.000   |

**~\$19.7M indicative cumulative funding gap, including \$1.5M development.**

Excludes working capital, financing costs and replacement reserves. EBITDA is not cash flow.

# Execution team and investment risks

Technology leadership must be paired with power-infrastructure and fleet experience.

## Nick Schrunk

Project lead. Technology entrepreneur and IT leader. Proposed focus: platform, partnerships and commercial development.

## Priority hires and partners

Charging development lead, utility engineer and fleet sales lead. Contract qualified construction and maintenance teams.

## Risk

**Slow fleet adoption**

**Utility delays / tariffs**

**Construction overruns**

**Downtime / compatibility**

**Capital availability**

## Planned control

Minimum-volume contracts

Written power and rate studies

Priced scope and contingency

Service contract and truck tests

Stage gates before expansion

# Proposed investment and use of funds

Draft development raise: \$1.5M. Separate pilot construction requirement: \$4.5M.

| Development use                   | USD     |
|-----------------------------------|---------|
| Team and fleet development        | \$600K  |
| Site options, studies and permits | \$450K  |
| Software, legal and insurance     | \$250K  |
| Contingency                       | \$200K  |
| Total proposed raise              | \$1.50M |

## The next investable milestone

A pilot with site control, a priced utility connection, fleet volume contracts and a complete construction budget.

**Funding structure and terms remain open for founder and investor review.**
